

Maha E-Seva Kendra

Complete visual, interaction, responsive and motion specification for the production website

Design direction: professional local-service business, warm and trustworthy, modern without looking like a generic SaaS template, interactive without sacrificing speed.

Authoritative rule: the selected second colour-palette direction from the approved design exploration is the visual source of truth. The exact colour tokens below should be implemented centrally so the palette can be fine-tuned without changing components.

System	Decision
Primary personality	Trustworthy • local • clear • modern • approachable
Visual character	Warm white surfaces, orange/terracotta accents, restrained dark text, subtle depth
Primary UX priority	Understand service → see price → know documents → contact
Motion priority	Feedback and hierarchy, never decoration for its own sake
Responsive priority	Mobile-first and thumb-friendly
Performance rule	No visual effect is allowed to make the website feel slow

1. Design Principles

The website should communicate the feeling of a reliable local service desk that has modernized its customer experience. It should not resemble a government department portal, an e-commerce marketplace, or a flashy AI/SaaS landing page.

Core principles

- 1 **Clarity before decoration.** Users should immediately understand what the centre does.
- 2 **Trust before persuasion.** Address, pricing context, genuine reviews and service details must be easy to verify.
- 3 **Action should be obvious.** Call, WhatsApp and directions should never be difficult to find.
- 4 **Progressive disclosure.** Show the most important information first and reveal detail through sections, accordions and dedicated pages.
- 5 **Consistency at scale.** All 32 services use the same service-card and service-detail language.
- 6 **Motion with purpose.** Animation communicates hierarchy, state and feedback; it does not delay content.
- 7 **Mobile is not a reduced desktop.** Mobile layouts should be intentionally designed for touch and quick scanning.
- 8 **Performance is part of design.** A beautiful page that loads slowly is considered a design failure.
- 9 **Accessibility is built in.** Keyboard access, readable contrast, focus states and reduced-motion behavior are mandatory.

2. Visual Identity

The selected second colour-palette direction should be implemented as a tokenized system. The exact palette can be adjusted against the approved visual reference, but components must never contain scattered hard-coded colours.

Colour roles

Token	Role	Guideline
Primary	Main brand/CTA colour	Use for primary actions, selected states and important accents.
Primary Hover	Interactive primary state	Slightly deeper/darker version; never a completely different hue.
Primary Soft	Tinted background	Use for badges, highlighted areas and subtle section backgrounds.
Accent	Secondary emphasis	Use sparingly for highlights, icons or important status.
Ink	Primary text	Near-black warm neutral; avoid pure black for large text.
Muted	Secondary text	Used for descriptions, metadata and helper text.
Surface	Cards / elevated areas	Warm white or very light neutral.
Background	Main page background	Clean warm white / neutral.
Border	Dividers / inputs	Low-contrast neutral.
Success	Positive status	Use only for success/available states.
Warning	Attention / deadline	Use for scheme deadlines and warnings.
Error	Validation / failure	Use only for actual errors.

Colour usage ratio

A practical visual ratio is approximately **70–80% neutral surfaces**, **15–20% dark typography/structure**, and **5–10% brand accent**. Orange/terracotta should feel intentional rather than covering the entire page.

Do not

- Use violet/blue/green as competing brand colours.
- Use gradients everywhere.
- Use bright orange for long paragraphs or huge backgrounds.
- Use colour alone to communicate status.
- Create a different palette for each service category.

3. Typography

Typography should feel editorial and highly readable. The site should use a modern sans-serif family with excellent Latin/Devanagari support if Marathi content is later introduced. Use as few font weights as possible.

Type scale

Element	Desktop	Mobile	Weight / purpose
Display / Hero	48–64px	34–42px	Strong, short headline
H1	40–52px	30–36px	Page title
H2	28–36px	24–30px	Major section
H3	20–24px	18–21px	Card/section subheading
Body large	18px	17px	Hero supporting text
Body	16px	15.5–16px	Default reading
Small	13–14px	13px	Metadata/helper
Button	14–16px	14–15px	Medium/bold

Typography rules

- Body line length should normally stay around 55–80 characters for long-form reading.
- Use generous line-height rather than oversized font sizes to create readability.
- Headlines should be concise; avoid wrapping a hero heading into four or five lines.
- Use weight changes to establish hierarchy instead of excessive colour changes.
- Never use all-caps for long sentences.

4. Spacing & Layout

Use a consistent spacing scale based on 4px increments. Components should feel spacious but not wasteful.

Token	Value	Typical use
xs	4px	Icon/text gap, micro spacing
sm	8px	Compact card spacing
md	12px	Input/card internal spacing
lg	16px	Default component spacing
xl	24px	Card/section spacing
2xl	32px	Large component spacing

Token	Value	Typical use
3xl	48px	Section internal spacing
4xl	64px	Desktop section spacing
5xl	80–96px	Major page section separation

Container

- Desktop max content width: approximately 1180–1240px.
- Large screens should retain comfortable side margins rather than stretching text across the viewport.
- Mobile side padding: approximately 16–20px.
- Tablet side padding: approximately 24–32px.
- Desktop side padding: approximately 32–48px.

5. Shape, Borders & Elevation

The visual language should use soft but controlled rounding. Avoid the 'everything is a pill' look.

Element	Radius
Small controls	8px
Inputs / buttons	10–12px
Service cards	16–20px
Large feature cards	20–24px
Modal / sheet	20–24px
Pills / status badges	999px

Elevation

- Default cards: very subtle border with minimal shadow.
- Hover cards: slightly stronger shadow + 2–5px vertical lift.
- Floating WhatsApp button: visible elevation but not a huge glow.
- Avoid heavy shadows that make the site look like a dashboard.

6. Iconography

Use one coherent outline icon family, preferably Lucide or an equivalent lightweight SVG icon set. Icons should support comprehension rather than become decorative illustrations.

Examples

Service type	Suggested icon direction
Certificates	FileText / BadgeCheck
Aadhaar / ID	Contact / CreditCard
Passport	BookOpen / Plane
Driving licence	Car
Health	HeartPulse / ShieldPlus

Service type	Suggested icon direction
Banking	Landmark / WalletCards
Insurance	ShieldCheck
Business	BriefcaseBusiness / Store
Photography / printing	Camera / Printer
Government schemes	Landmark / Sparkles used sparingly

Icon rules

- Keep stroke weight consistent.
- Do not mix emoji and professional line icons in the same component.
- Use icon containers with a subtle brand tint when helpful.
- Never use an icon as the only explanation of a service.

7. Global Navigation

The navigation must prioritize service discovery and conversion.

Desktop

Recommended structure: **Logo** → **Home** → **Services** → **Schemes** → **Blog** → **About** → **Contact** → **primary WhatsApp action**. Keep the navigation compact.

Mobile

Use a clean menu trigger. The opened menu should include the primary pages plus high-visibility Call/WhatsApp actions. The menu should close after navigation and support Escape/keyboard interaction.

Announcement bar

Optional top strip for genuinely useful temporary information such as a new scheme, holiday hours or service update. It must be dismissible if persistent. Never use it for fake urgency.

8. Homepage UX

The homepage is a guided journey rather than a collection of unrelated sections.

Section order

Order	Section	UX purpose
01	Announcement	Surface a real timely update if one exists.
02	Navbar	Navigation and immediate contact.
03	Hero	Identify centre + promise + primary action.
04	Popular Services	Help users reach common services quickly.
05	All Services preview	Show breadth and establish 32-service capability.
06	Schemes	Show current useful government updates.
07	Why Choose Us	Explain practical trust/value reasons.
08	Pricing highlights	Reinforce transparent local pricing.

Order	Section	UX purpose
09	Reviews	Social proof.
10	Blog	Answer common questions and support SEO.
11	Location	Convert online visitor into physical visit.
12	FAQ	Resolve remaining objections.
13	Final CTA	Give direct contact options.
14	Footer	Navigation, business information and legal links.

Hero composition

Eyebrow: MAHA E-SEVA KENDRA

Headline: Government & Online Services Made Simple in Nerul

Supporting line: Short explanation of certificates, IDs, applications, licences, banking, insurance and other services.

Actions: Explore Services + WhatsApp/Contact.

Trust cues: transparent pricing, local service centre, assistance with online applications.

Hero visual direction

- Prefer a real business/environment visual or a restrained service-oriented composition over generic AI imagery.
- Keep the focal point clear and avoid busy backgrounds behind text.
- Use subtle layered shapes, cards or document motifs if a purely graphic hero is used.
- Do not use a giant video background.

9. Service Catalogue UX

The 32 services are a major product feature and must be easy to scan.

Service card anatomy

Each card should contain: icon → service name → one-line explanation → service charge (when confirmed) → optional status/popular label → directional affordance.

Card interaction

State	Behavior
Default	Neutral surface, clear title, subtle border.
Hover	2–5px lift, slightly stronger shadow/border, icon or arrow movement.
Focus	Visible keyboard focus ring; never remove it.
Pressed	Small scale-down/visual feedback, approximately 0.98.
Disabled	Only when genuinely unavailable; explain why.
Mobile	Tap target remains comfortably large; avoid hover-dependent information.

Search/filter UX

- Search should respond immediately for only 32 services.
- Category filters should be obvious and horizontally scrollable on small screens if necessary.
- Show result count when helpful.

- Provide a clear 'All Services' state.
- No search result should leave the user stranded; show a useful empty state with contact action.

10. Service Detail UX

The service page is the highest-intent template and should answer questions in the order users typically ask them.

Order	Section	Purpose
01	Breadcrumb	Orientation + SEO hierarchy.
02	Hero	Service name, local context, price and primary CTA.
03	Quick facts	Price, category, broad processing note if verified.
04	About service	Simple explanation.
05	Documents	What to bring/prepare.
06	Eligibility	Who it generally applies to, when verified.
07	Process	Simple step-by-step.
08	Pricing	Centre charge + government fee distinction.
09	FAQ	Resolve common questions.
10	Related services	Cross-sell relevant needs without aggressive selling.
11	Related guides	Blog/content links.
12	Final CTA	WhatsApp + call + visit.

Price visibility

Do not hide the centre's service charge behind a contact form. The purpose is transparent local service discovery. If a government fee is separate, label it separately.

Documents list

Use checkmark rows/cards with enough spacing. If requirements vary, place a short note immediately below the list. Avoid presenting unverified documents as absolute requirements.

11. Schemes UX

Schemes are time-sensitive. Their interface must make freshness visible.

Scheme card

Card: status badge → scheme name → short benefit/description → last updated → 'View details'.

Scheme detail

Section	Requirement
Status	NEW / UPDATED / APPLICATIONS OPEN / DEADLINE SOON / CLOSED
Last updated	Always visible near the top.
Overview	Simple explanation.
Eligibility	Only verified information.
Benefits	Clear bullets.

Section	Requirement
Documents	Verified requirements.
How to apply	Step-by-step assistance.
Important dates	If applicable.
Official source	Link to authoritative government source when available.
CTA	Contact centre for assistance.

12. Blog UX

The blog should feel like a useful local information centre, not a content farm.

Blog card

- Category label.
- Article title.
- Short excerpt.
- Published/updated date.
- Reading time if useful.
- Relevant image only when it improves comprehension.
- Clear link to read.

Article page

Use: breadcrumbs → H1 → metadata → short answer/summary → optional table of contents → article → FAQ → related services → related articles → CTA.

13. FAQ UX

Use accessible accordion behavior. Clicking the question toggles the answer; keyboard users must be able to operate it.

Interaction rules

- Only one answer needs to be open at a time on dense service pages, although multiple-open can be supported if it improves usability.
- Animate height/opacity smoothly around 200–300ms.
- Do not use dramatic bounce.
- Question text must remain readable in both open and closed states.
- Provide visible focus state.

14. Contact & Conversion UX

Contact interactions should feel immediate and low-friction.

Contact form fields

Required: Name, Phone, Service. **Optional:** Message / preferred contact. Avoid requesting Aadhaar/PAN numbers or document uploads in the basic form.

Form states

State	UX
Default	Simple labels, clear required markers.
Focus	Visible border/focus ring.
Invalid	Specific, human-readable error.
Submitting	Button indicates progress without freezing the page.
Success	Confirmation + optional WhatsApp/call action.
Failure	Explain that submission failed and offer call/WhatsApp fallback.

WhatsApp UX

Use contextual messages where useful, for example a service-specific enquiry. The button should open WhatsApp with a concise prefilled message rather than an empty chat whenever technically appropriate.

15. Location UX

The location section should make the centre easy to physically reach.

Recommended composition

Address and hours on one side; lightweight map preview and 'Get Directions' action on the other. On mobile, stack address → hours → directions → map preview.

Performance rule

Do not load a heavy interactive map as part of the critical homepage payload. Use a lightweight preview and load the full map only after user intent, or link directly to Google Maps.

16. Reviews & Social Proof

Use genuine review information only. Do not rewrite customer reviews to make them sound better or manufacture testimonials.

Review section

- Show the verified business rating only when the displayed value is current and sourced appropriately.
- Use short authentic excerpts if the business has permission/appropriate source usage.
- Link users toward the business's Google profile where practical.
- Avoid overwhelming the homepage with dozens of reviews; a curated small set is enough.
- Do not use review schema in ways that violate search-engine guidelines.

17. Motion & Animation System

Motion should make the interface feel alive while preserving the seriousness of a real-world service business.

Motion hierarchy

Level	Use	Example
Micro	Immediate feedback	Button press, icon movement, input focus

Level	Use	Example
Component	State change	Accordion, mobile menu, card hover
Section	Reveal hierarchy	Section enters viewport
Page	Rare	Route/page transition
Ambient	Very limited	Subtle decorative movement in hero

Recommended motion timings

Interaction	Duration	Easing
Hover	150–220ms	Ease-out
Button press	100–150ms	Ease-out
Accordion	220–300ms	Ease-in-out
Mobile menu	250–350ms	Ease-out
Scroll reveal	400–600ms	Ease-out
Page transition	250–400ms	Ease-in-out
Ambient	Slow / subtle	Linear or gentle ease

Scroll reveal

Default reveal: opacity 0 → 1 plus translateY approximately 16–24px → 0. Use staggered children only within small groups. Never make 32 service cards animate one after another.

Hero entrance

Headline → supporting text → CTA → visual, with short stagger intervals. Total perceived entrance should remain roughly under one second.

Card hover

Lift slightly, strengthen shadow/border, move arrow 3–6px, optionally scale the icon by 1.03–1.06. Avoid large zoom effects.

Motion restrictions

- No perpetual motion on essential UI.
- No flashing effects.
- No large parallax that causes discomfort or battery drain.
- No animation that blocks clicking.
- No animation-only disclosure of important information.
- Respect prefers-reduced-motion by removing nonessential transforms and ambient motion.

18. Button System

Keep a small set of variants so the site remains coherent.

Variant	Purpose	Examples
Primary	Main action	Explore Services / Get Started

Variant	Purpose	Examples
Secondary	Supporting action	View Services
Outline	Low-emphasis action	View Details
Ghost	Navigation/inline	Learn More
WhatsApp	High-intent communication	WhatsApp Us
Call	High-intent communication	Call Now

Button rules

- Use verbs: 'View Services', 'Get Directions', 'WhatsApp Us', 'Call Now'.
- Avoid vague CTAs such as 'Click Here'.
- Minimum touch target should be comfortably tappable, approximately 44px or more.
- Do not put more than one visually dominant primary action in the same compact region.

19. Cards & Content Surfaces

Three major card families: Service Card, Scheme Card and Blog/Content Card. They share the same underlying visual language but have different content hierarchy.

Service card

Most information-dense. Price is important. Use a strong title, short description and clear arrow.

Scheme card

Status and freshness are more important than price. Last-updated information should be visible.

Blog card

Title and article usefulness are primary. Avoid excessive metadata.

20. Responsive Design

Breakpoints should be chosen around content behavior rather than device brand names.

Range	Layout intent
~320–479px	Small mobile: one-column, compact spacing, sticky contact actions.
~480–767px	Large mobile: one-column, wider cards, optional horizontal filter rows.
~768–1023px	Tablet: two-column content where appropriate, desktop-style navigation may appear if space allows.
~1024–1279px	Laptop: full navigation and multi-column service grid.
1280px+	Desktop: generous whitespace, max-width container, 3–4 service columns.

Mobile-specific rules

- No hover-only interaction.
- Avoid tiny filter controls.
- Keep phone/WhatsApp easy to reach.
- Service cards should be compact enough to scan without excessive scrolling.

- Avoid side-by-side content that produces unreadably narrow text.
- Use bottom sheets/modals sparingly.
- Do not place a floating WhatsApp button where it overlaps the sticky CTA.

21. Loading, Empty & Error States

States should look intentional and professional.

State	Behavior
Initial content load	Prefer rendered content over unnecessary skeletons.
Search empty	Explain no service matched + clear search + contact option.
Scheme empty	Explain that no current schemes are published; do not show fake cards.
Blog empty	Useful message rather than blank space.
404	Friendly explanation + Services + Home + Contact actions.
Form error	Specific error + retry + call/WhatsApp fallback.

22. Accessibility UX

- Semantic heading hierarchy.
- Keyboard-operable menus, accordions, buttons and forms.
- Visible focus rings.
- ARIA only where semantic HTML is insufficient.
- Sufficient text contrast.
- Large enough touch targets.
- Do not rely on colour alone for scheme status or form errors.
- Reduced-motion support.
- Respect browser zoom; content should remain usable at increased text size.

23. Performance-Aware Design Rules

- Prefer CSS transitions and transforms over large animation assets.
- Use SVG icons rather than large raster icon files.
- Optimize hero imagery aggressively.
- Do not preload every below-fold image.
- Lazy-load non-critical sections where it actually helps.
- Keep third-party embeds out of the critical rendering path.
- Avoid full-screen video backgrounds.
- Do not load a heavy animation framework if a small CSS transition is enough.
- Use responsive image dimensions to prevent layout shift.
- Maintain stable layout space for images and embeds.

24. Content Presentation Rules

- Use short paragraphs and scannable lists.
- Highlight service price without making the entire design feel commercial.
- Use callout boxes for important caveats.
- Government information should be visually distinct from the centre's own pricing.
- Use 'Last updated' labels for time-sensitive scheme/content pages.
- Avoid fake urgency such as countdown timers unless there is a genuine deadline.

25. Design Anti-Patterns — Explicitly Prohibited

- Generic AI-generated website aesthetic.
- Overuse of gradients/glows.
- Violet/blue SaaS-style palette competing with the approved warm palette.
- Huge text that pushes useful service information below the fold.
- Excessive glassmorphism.
- 32 completely different service card designs.
- Huge animations on every scroll.
- Autoplay video with sound.
- Popups immediately after page load.
- Fake government seals/logos or wording that could imply official government ownership.
- Hidden pricing designed to force an enquiry.
- Fake testimonials or fabricated reviews.
- Unverified claims about government approval, processing guarantees or eligibility.

26. Visual QA Checklist

- Does the page look professional at 360px mobile width?
- Are all CTAs obvious without being aggressive?
- Can a user find Services in one obvious step?
- Can a user identify the service price quickly?
- Are documents easy to scan?
- Does the selected palette remain consistent across all pages?
- Are cards aligned and visually balanced?
- Are hover/focus states consistent?
- Do animations feel fast and purposeful?
- Does reduced motion work?
- Does the page remain readable when browser zoom is increased?
- Does the map avoid slowing the initial page?
- Does the mobile sticky CTA avoid covering important content?
- Are there any unnecessary visual elements that do not help understanding, trust, speed or conversion?

27. Final Design Principle

Premium does not mean complicated. The final experience should feel polished because spacing, typography, hierarchy, motion, content and interactions are carefully controlled—not because the page contains more effects.

The design system is successful when a resident can land on the website, recognize the business, find the required service, understand the documents and price, trust the centre and contact it within a few deliberate interactions.
